

SOLUTIONS ENGINEER / FORWARD DEPLOYED ENGINEER

Solutions Engineer / Forward Deployed Engineer with 6+ years of experience delivering enterprise software, integrations, automation, and data-heavy workflows for global clients. Turns ambiguous customer requirements into production-ready systems by owning the solution end to end across discovery, solution architecture, development, implementation, technical demos, training, and go-live. Hands-on with AI-enabled and agentic product workflows through independent full-stack product work.

TECHNICAL SKILLS

Practice	: 0-1 delivery, customer stakeholder management, pain-point discovery, requirements clarification, pre/post-sales engineering, technical demos, solution architecture, integration design, workflow design, customer training
Languages	: TypeScript/JavaScript, Python, Java, SQL
Backend	: Node.js, AWS, REST APIs, PostgreSQL, SAP/ERP integrations, Spring Framework, SQL Server
Frontend	: React, Vite, Tailwind CSS, React Router, shadcn/ui, TanStack
AI workflow	: Vercel AI SDK, MCP, RAG, pgvector, Claude, Codex, Langfuse, agentic workflows
Tooling	: Git, GitHub Actions, Jira, Linux, Docker, Playwright, Vitest, Prisma, Zod, pnpm, OpenAPI/Swagger, Postman

EXPERIENCE

Software Implementation Engineer	2021–Present
UL Solutions	Remote / UK
- Delivered 15+ complex enterprise implementations for global clients, including business-critical rollouts, owning requirements discovery, solution architecture, technical specifications, development, training, and go-live delivery. - Designed a multi-level BOM automation workflow in JavaScript, reducing setup time from ~1 hour to ~2 minutes; it became the core reusable implementation pattern, reshaped how sales demos were delivered, and influenced roadmap decisions. - Implemented enterprise system integrations using REST APIs, JSON/XML payloads, and data mapping, including SAP/ERP and external service workflows. - Delivered backend, frontend, SQL, and reporting development across complex data workflows, including schema design, stored procedures, triggers, bulk operations, validation, and customer-specific outputs. - Worked closely with customer stakeholders, internal development, product, QA, and support teams to clarify vague requests, define responsibilities, communicate risks, and turn recurring implementation issues into product and roadmap feedback.	
Technical Support Analyst	2019–2021
UL Solutions (formerly Cimteq)	Remote / UK
- Resolved the highest volume of support tickets on the team — 96% above the team average — across complex application logic, configuration, database, reporting, and integration issues. - Built Python tools to automate report and XML investigation workflows, reducing repetitive debugging work. - Authored the highest number of technical Confluence knowledge-base pages on the team, documenting recurring application, reporting, and integration issues.	

EDUCATION

MSc Computer Science, University of Warwick — Distinction	2018–2019
Modules (Python-based): Agent-Based Systems, Foundations of Computing, Data Analytics, Natural Language Processing. Built Python auction bidding bots, with one scoring 7.2/7.5 and outperforming almost all 60+ submissions.	
University of Electronic Science and Technology of China	2011–2018
MSc Electronics & Communication Engineering; BEng Communication Engineering, GPA 3.7 / 4.0	

PROJECTS & ADDITIONAL

Independent full-stack AI product work with MCP, Vercel AI SDK, RAG, pgvector, and agentic workflows
- Built deployable React/TypeScript and Node.js applications with structured product logic, user-facing interfaces, authentication, PostgreSQL/Prisma persistence, and deployment-oriented project structure. - Designed features using vertical slice architecture, organising each slice across UI, API/server logic, validation, database schema, AI orchestration, and tests. - Built RAG and vector-search workflows with PostgreSQL/pgvector, knowledge-base retrieval, and knowledge tooling that connect user queries to structured business context and generated responses. - Implemented automated testing with schema validation, unit/integration coverage, and Playwright E2E flows for production-style AI and full-stack product workflows.
2022: Wikimedia Hackathon contributor — Project Quarry. Contributed UI and backend improvements to an analytics tool.
2016–2017: Teaching assistant, undergraduate TCP/IP course.
Languages: English, Mandarin.
